Question 1 [C01] [10 Points]

You are an HR software developer tasked with creating a **Java program** that calculates employees' promoted salary and loyalty bonus automatically. The program should take two inputs from the user: the employee's **current salary** and their **years of service**. The company follows a tiered promotion structure: employees earning up to **50,000 BDT** receive a **5% promotion**, those earning between **50,001 and 100,000 BDT** receive a **7% promotion**, and employees with salaries above **100,000 BDT** receive a **10% promotion**.

In addition to the base promotion, a **loyalty bonus** is applied based on the employee's years of service. Employees with **up to 5 years** of service receive a **5% bonus**, and those with **more than 5 years** receive an additional **1% bonus for each extra year** beyond five. Your program should calculate and display the **total new salary** clearly.

Input	Output
Current salary in BDT = 120000 Years of service = 8	Total new salary = 141600.00 BDT
Explanation: Base promotion salary = $120000 \times 0.1 = 12000$ BDT Years of service = 8 years Extra years = $8 - 5 = 3$ years Total bonus rate = $5\% + (3 \times 1\%) = 5\% + 3\% = 8\%$ Bonus = $8\% \text{ of } 120000 = 0.08 \times 120000 = 9600$ BDT Total Salary = Current Salary + Base promotion salary + Bonus Total Salary = $120000 + 12000 + 9600$ BDT = 141600.00 BDT
