Question 1 [C01] [10 Points]

At **BRAC University**, the brilliant **Professor Parity** has introduced an exciting number challenge for his students. Each student must submit a **positive number**. For that number, perform the following:

- Calculate the **LuckyNumber** by **alternatively adding and subtracting** the even digits as they appear from left to right.
(For example, if the number is 345482, the even digits are 4, 4, 8, and 2.
So, **LuckyNumber = 4 - 4 + 8 - 2 = 6.**)

Write a Java program that reads a number from the user, performs the alternating sum and subtraction of its even digits, and displays the **Lucky Number**.

Note: You must implement this without converting the integer into a string and without using any string manipulation methods. Use only arithmetic operations to extract each digit. You must use a loop to solve this problem.

Sample Input	Sample Output	Explanation
Enter a positive number: 345482	Lucky Number is: 6	Given number: 345482 Even Digits: 4,4,8 and 2 LuckyNumber: 4 - 4 + 8 - 2 = 6
Enter a positive number: 135	Lucky Number is: 0	Given number: 135 There is no even digit. So, LuckyNumber=0.
